Preface	xvii
Acronyms	xxiii
Notation	xxv
I Introduction	1
1 Correlation, Association, and the Yule–Simpson Paradox	3
1.1 Traditional view of statistics	3
1.2 Some commonly-used measures of association	3
1.2.1 Correlation and regression	3
1.2.2 Contingency tables	4
1.3 An example of the Yule–Simpson Paradox	6
1.3.1 Data	6
1.3.2 Explanation	8
1.3.3 Geometry of the Yule–Simpson Paradox	9
1.4 The Berkeley graduate school admission data	9
1.5 Homework problems	12
2 Potential Outcomes	15
2.1 Experimentalists’ view of causal inference	15
2.2 Formal notation of potential outcomes	16
2.2.1 Causal effects, subgroups, and the non-existence of Yule–Simpson Paradox	17
2.2.2 Subtlety of the definition of the experimental unit	18
2.3 Treatment assignment mechanism	18
2.4 Homework problems	20
II Randomized experiments	23
3 The Completely Randomized Experiment and the Fisher Randomization Test	25
3.1 CRE	25
3.2 FRT	26
3.3 Canonical choices of the test statistic	28
3.4 A case study of the LaLonde experimental data	32
3.5 Some history of randomized experiments and FRT	34
3.5.1 James Lind’s experiment	34
3.5.2 Lady Tasting Tea	36
3.5.3 Two Fisherian principles for experiments	36
3.6 Discussion	37
3.6.1 Other sharp null hypotheses and confidence intervals	37

3.6.2	Other test statistics	37
3.6.3	Final remarks	38
3.7	Homework problems	38
4	Neymanian Repeated Sampling Inference in Completely Randomized Experiments	41
4.1	Finite population quantities	41
4.2	Neyman's (1923) theorem	42
4.3	Proofs	45
4.3.1	Unbiasedness	45
4.3.2	Variance formulas	46
4.3.3	Unbiased variance estimation	46
4.4	Regression analysis of the CRE	46
4.5	Examples	47
4.5.1	Simulation	47
4.5.2	Heavy-tailed outcome and failure of Normal approximations	48
4.5.3	Application	48
4.6	Homework problems	52
5	Stratification and Post-Stratification in Randomized Experiments	57
5.1	Stratification	57
5.2	FRT	59
5.2.1	Theory	59
5.2.2	An application	61
5.3	Neymanian inference	63
5.3.1	Point and interval estimation	63
5.3.2	Numerical examples	63
5.3.3	Comparing the SRE and the CRE	65
5.4	Post-stratification in a CRE	68
5.4.1	Reanalyzing the data from Meinert et al. (1970)	69
5.4.2	Reanalyzing the data from Chong et al. (2016)	70
5.5	Practical questions	71
5.6	Homework problems	72
6	Rerandomization and Regression Adjustment	75
6.1	Rerandomization	75
6.1.1	Experimental design	75
6.1.2	Statistical inference	76
6.2	Regression adjustment	78
6.2.1	Covariate-adjusted FRT	78
6.2.2	Analysis of covariance and extensions	79
6.2.3	Some additional remarks on regression adjustment	83
6.2.4	Extension to the SRE	84
6.3	Discussion	84
6.3.1	Duality between ReM and regression adjustment	84
6.3.2	Unification of ReM and regression adjustment	85
6.3.3	Final recommendation	85
6.4	Simulation	85
6.5	Final remarks	86
6.6	Homework problems	88

7	Matched-Pairs Experiment	91
7.1	Design of the experiment and potential outcomes	91
7.2	FRT	92
7.3	Neymanian inference	95
7.4	Covariate adjustment	97
7.4.1	FRT	97
7.4.2	Regression adjustment	97
7.5	Examples	99
7.5.1	Darwin's data comparing cross-fertilizing and self-fertilizing on the height of corns	99
7.5.2	Children's Television Workshop experiment data	100
7.6	Comparing the MPE and CRE	102
7.7	Extension to the general matched experiment	103
7.7.1	FRT	103
7.7.2	Estimating the average of the within-strata effects	104
7.7.3	A more general causal estimand	104
7.8	Homework problems	105
8	Unification of the Fisherian and Neymanian Inferences in Randomized Experiments	109
8.1	Testing strong and weak null hypotheses in the CRE	109
8.1.1	CRE without covariates	109
8.1.2	Covariate-adjusted FRTs in the CRE	111
8.1.3	General recommendations	111
8.2	A simulation study	112
8.3	A case study	112
8.4	Homework problems	115
9	Bridging Finite and Super Population Causal Inference	117
9.1	CRE	118
9.2	Simulation under the CRE: the super population perspective	119
9.3	Extension to the SRE	120
9.4	Homework problems	121

III Observational studies 123

10	Observational Studies, Selection Bias, and Nonparametric Identification of Causal Effects	125
10.1	Motivating examples	125
10.2	Causal effects and selection bias under the potential outcomes framework	126
10.3	Sufficient conditions for nonparametric identification of causal effects	128
10.3.1	Identification	128
10.3.2	Plausibility of the ignorability assumption	130
10.4	Two simple estimation strategies and their limitations	131
10.4.1	Stratification or standardization based on discrete covariates	131
10.4.2	Outcome regression	131
10.5	Homework problems	133

11 The Central Role of the Propensity Score in Observational Studies for Causal Effects	137
11.1 The propensity score as a dimension reduction tool	138
11.1.1 Theory	138
11.1.2 Propensity score stratification	139
11.1.3 Application	140
11.2 Propensity score weighting	141
11.2.1 Theory	141
11.2.2 Inverse propensity score weighting estimators	142
11.2.3 A problem of IPW and a fundamental problem of causal inference	143
11.2.4 Application	144
11.3 The balancing property of the propensity score	145
11.3.1 Theory	145
11.3.2 Covariate balance check	146
11.4 Homework problems	147
12 The Doubly Robust or the Augmented Inverse Propensity Score Weighting Estimator for the Average Causal Effect	151
12.1 The doubly robust estimator	151
12.1.1 Population version	151
12.1.2 Sample version	153
12.2 More intuition and theory for the doubly robust estimator	153
12.2.1 Reducing the variance of the IPW estimator	154
12.2.2 Reducing the bias of the outcome regression estimator	154
12.3 Examples	154
12.3.1 Summary of some canonical estimators for the average causal effect	154
12.3.2 Simulation	156
12.3.3 Applications	157
12.4 Some further discussion	158
12.5 Homework problems	158
13 The Average Causal Effect on the Treated Units and Other Estimands	161
13.1 Nonparametric identification of τ_T	161
13.2 Inverse propensity score weighting and doubly robust estimation of τ_T	163
13.3 An example	165
13.4 Other estimands	166
13.5 Homework problems	167
14 Using the Propensity Score in Regressions for Causal Effects	171
14.1 Regressions with the propensity score as a covariate	171
14.2 Regressions weighted by the inverse of the propensity score	174
14.2.1 Average causal effect	174
14.2.2 Average causal effect on the treated units	176
14.3 Homework problems	177
15 Matching in Observational Studies	179
15.1 A simple starting point: many more control units	179
15.2 A more complicated but realistic scenario	180
15.3 Matching estimator for the average causal effect	181
15.3.1 Point estimation and bias correction	181
15.3.2 Connection with the doubly robust estimators	183

15.4 Matching estimator for the average causal effect on the treated	184
15.5 A case study	185
15.5.1 Experimental data	185
15.5.2 Observational data	186
15.5.3 Covariate balance checks	187
15.6 Discussion	188
15.7 Homework problems	189

IV Difficulties and challenges of observational studies 191

16 Difficulties of Unconfoundedness in Observational Studies for Causal Effects	193
16.1 Some basics of the causal diagram	193
16.2 Assessing the unconfoundedness assumption	194
16.2.1 Using negative outcomes	194
16.2.2 Using negative exposures	195
16.2.3 Summary	196
16.3 Problems of over-adjustment	196
16.3.1 M-bias	196
16.3.2 Z-bias	198
16.3.3 What covariates should we adjust for in observational studies?	200
16.4 Homework problems	201
17 E-Value: Evidence for Causation in Observational Studies with Unmeasured Confounding	203
17.1 Cornfield-type sensitivity analysis	203
17.2 E-value	206
17.3 A classic example	207
17.4 Extensions	208
17.4.1 E-value and Bradford Hill's criteria for causation	208
17.4.2 E-value after logistic regression	210
17.4.3 Non-zero true causal effect	211
17.5 Critiques and responses	212
17.5.1 E-value is just a monotone transformation of the risk ratio	212
17.5.2 Calibration of the E-value	212
17.5.3 It works the best for a binary outcome and the risk ratio	213
17.6 Homework problems	213

18 Sensitivity Analysis for the Average Causal Effect with Unmeasured Confounding	217
18.1 Introduction	217
18.2 Manski-type worst-case bounds on the average causal effect without assumptions	218
18.3 Sensitivity analysis for the average causal effect	219
18.3.1 Identification formulas	219
18.3.2 Example	221
18.3.3 Practical implementation of the sensitivity analysis method	223
18.4 Homework problems	224

19 Rosenbaum-Style p-Values for Matched Observational Studies with Unmeasured Confounding	227
19.1 A model for sensitivity analysis with matched data	227
19.2 Worst-case p -values under Rosenbaum's sensitivity analysis model	228
19.3 Examples	229
19.3.1 Revisiting the LaLonde data	229
19.3.2 Two examples from Rosenbaum's packages	230
19.4 Homework problems	233
20 Overlap in Observational Studies: Difficulties and Opportunities	235
20.1 Implications of overlap	235
20.1.1 Trimming in the presence of limited overlap	236
20.1.2 Outcome modeling in the presence of limited overlap	236
20.2 Causal inference with no overlap: regression discontinuity	237
20.2.1 Examples and graphical diagnostics	237
20.2.2 A mathematical formulation of regression discontinuity	239
20.2.3 Regressions near the boundary	240
20.2.4 An example	241
20.2.5 Problems of regression discontinuity	242
20.3 Homework problems	243
V Instrumental variables	245
21 An Experimental Perspective of the Instrumental Variable	247
21.1 Encouragement design and noncompliance	247
21.2 Latent compliance status and effects	248
21.2.1 Nonparametric identification	248
21.2.2 Estimation	250
21.3 Covariates	252
21.3.1 Covariate adjustment in the CRE	252
21.3.2 Covariates in conditional randomization or unconfounded observational studies	253
21.4 Weak IV	253
21.4.1 Some simulation	253
21.4.2 A procedure robust to weak IV	253
21.4.3 Implementation and simulation	255
21.5 Application	256
21.6 Interpreting the CACE	258
21.7 Homework problems	260
22 Disentangle Mixture Distributions and Instrumental Variable Inequalities	265
22.1 Disentangle mixture distributions	265
22.2 Testable implications: instrumental variable inequalities	268
22.3 Examples	268
22.4 Homework problems	271

23 An Econometric Perspective of the Instrumental Variable	277
23.1 Examples of studies with IVs	278
23.2 Brief review of the ordinary least squares	279
23.3 Linear instrumental variable model	280
23.4 The just-identified case	281
23.5 The over-identified case	282
23.6 A special case: a single IV for a single endogenous treatment	284
23.6.1 Two-stage least squares	284
23.6.2 Indirect least squares	284
23.6.3 Weak IV	285
23.7 Application	285
23.8 Homework problems	287
24 Application of the Instrumental Variable Method: Fuzzy Regression Discontinuity	291
24.1 Motivating examples	291
24.2 Mathematical formulation	292
24.3 Application	294
24.3.1 Reanalyzing the data from Asher and Novosad (2020)	294
24.3.2 Reanalyzing the data from Li et al. (2015)	295
24.4 Discussion	296
24.5 Homework problems	297
25 Application of the Instrumental Variable Method: Mendelian Randomization	299
25.1 Background and motivation	299
25.2 MR based on summary statistics	301
25.2.1 Fixed-effect estimator	301
25.2.2 Egger regression	302
25.3 An example	303
25.4 Critiques of the analysis based on Mendelian Randomization	304
25.5 Homework problems	305
VI Causal mechanisms with post-treatment variables	307
26 Principal Stratification	309
26.1 Motivating examples	309
26.2 The problem of conditioning on the post-treatment variable	310
26.3 Conditioning on the potential values of the post-treatment variable	311
26.4 Statistical inference and its difficulty	313
26.4.1 Special case: truncation by death with binary outcome	313
26.4.2 Implementation of the bounds	315
26.4.3 An application	316
26.4.4 Extensions	317
26.5 Principal score method	317
26.5.1 Principal score method under strong monotonicity	317
26.5.2 An example	318
26.5.3 Extensions	320
26.6 Other methods for principal stratification	320
26.7 Homework problems	320

27 Mediation Analysis: Natural Direct and Indirect Effects	323
27.1 Motivating examples	323
27.2 Nested potential outcomes	324
27.2.1 Natural direct and indirect effects	324
27.2.2 Metaphysics or science	326
27.3 The mediation formula	327
27.4 The mediation formula under linear models	330
27.4.1 The Baron–Kenny method	331
27.4.2 An example	332
27.5 Sensitivity analysis	333
27.6 Homework problems	334
28 Controlled Direct Effect	337
28.1 Definition of the controlled direct effect	337
28.2 Identification and estimation of the controlled direct effect	337
28.3 Discussion	339
28.4 Homework problems	340
29 Time-Varying Treatment and Confounding	343
29.1 Basic setup and sequential ignorability	343
29.2 g-formula and outcome modeling	344
29.2.1 Plug-in estimation based on outcome modeling	346
29.2.2 Recursive estimation based on outcome modeling	347
29.3 Inverse propensity score weighting	348
29.3.1 IPW estimators based on estimated propensity scores	349
29.3.2 Simple numeric examples	349
29.4 Multiple time points	351
29.4.1 Marginal structural model	351
29.4.2 Structural nested model	352
29.5 Discussion	354
29.6 Homework problems	355
VII Appendices	361
A Probability and Statistics	363
A.1 Probability	363
A.1.1 Pearson correlation coefficient and squared multiple correlation coefficient	363
A.1.2 Multivariate Normal random vector	363
A.1.3 χ^2 and t distributions	364
A.1.4 Cauchy–Schwarz inequality	364
A.1.5 Tower property and variance decomposition	364
A.1.6 Limiting theorems	366
A.1.7 Delta method	366
A.2 Statistical inference	367
A.2.1 Point estimation	367
A.2.2 Confidence interval	368
A.2.3 Hypothesis testing	368
A.2.4 Wald-type confidence interval and test	369
A.2.5 Duality between constructing confidence sets and testing null hypotheses	369

A.3 Inference with two-by-two tables	370
A.3.1 Fisher’s exact test	370
A.3.2 Estimation with two-by-two tables	370
A.4 Two famous problems in statistics	371
A.4.1 Behrens–Fisher problem	371
A.4.2 Fieller–Creasy problem	372
A.5 Monte Carlo method in statistics	373
A.6 Bootstrap	373
A.7 Homework problems	374
B Linear and Logistic Regressions	377
B.1 Population ordinary least squares	377
B.2 Sample ordinary least squares	378
B.3 Frisch–Waugh–Lovell Theorem	379
B.4 Linear model	380
B.5 Weighted least squares	381
B.6 Logistic regression	382
B.6.1 Model	382
B.6.2 Maximum likelihood estimate	383
B.6.3 Extension to the case-control study	384
B.6.4 Logistic regression with weights	384
B.7 Homework problems	385
C Some Useful Lemmas for Simple Random Sampling From a Finite Population	389
C.1 Lemmas	389
C.2 Proofs	391
C.3 Homework problems	393
Bibliography	395
Index	417
